I am a Chartered Accountant who has worked in the Financial Services Technology space for over 20 years and now try to augment my knowledge with Programming and Data Science

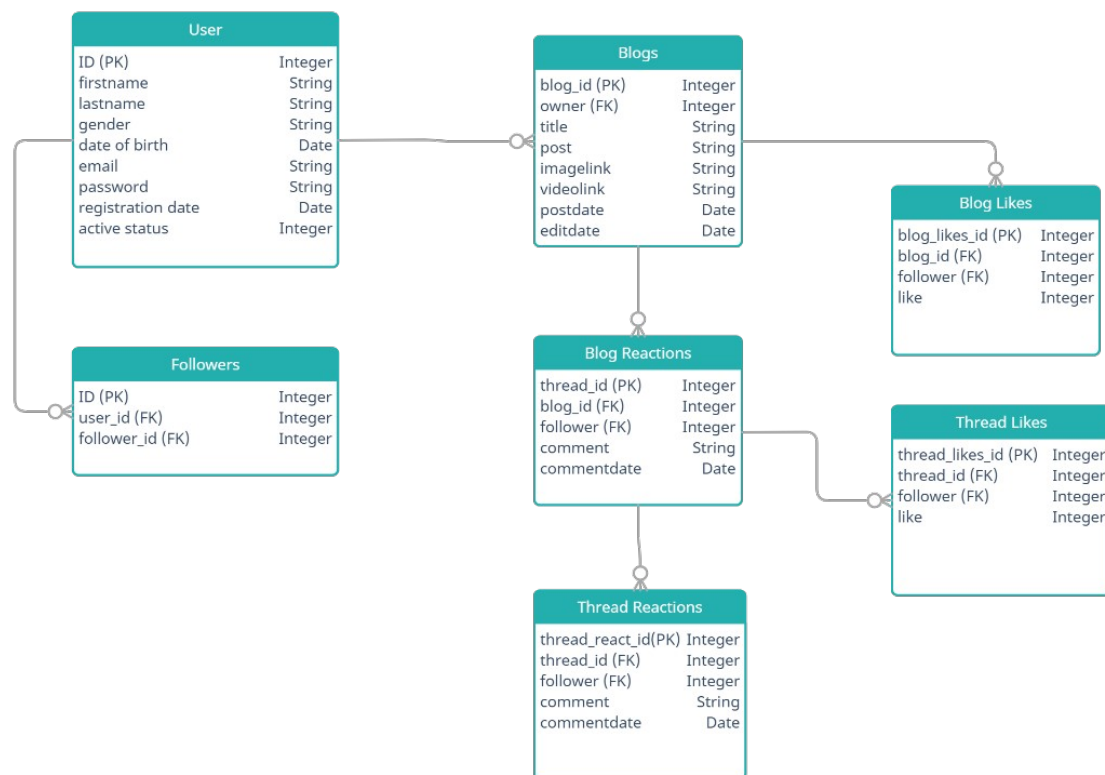

Description

BlogLite Project requires us to build a simple Blogging application that allows users to register, follow other users, post their blogs and read blogs by people they follow.

Technologies used

Python 3.9.4 – Business logic and controller, Sqlite - database, HTML5, CSS, Flask 2.2.2 – App server, Flask-Restful 0.3.9 – REST APIs, Flask-SQLAlchemy 3.0.0 – ORM and SQL injection, Vue 2.x, VueRouter 4.x and Vuex 3.x along with Javascript for UI handling, Celery & Redis for time triggered and user triggered asynchronous jobs, JWT for Token based authentication

DB Schema Design

Relationship

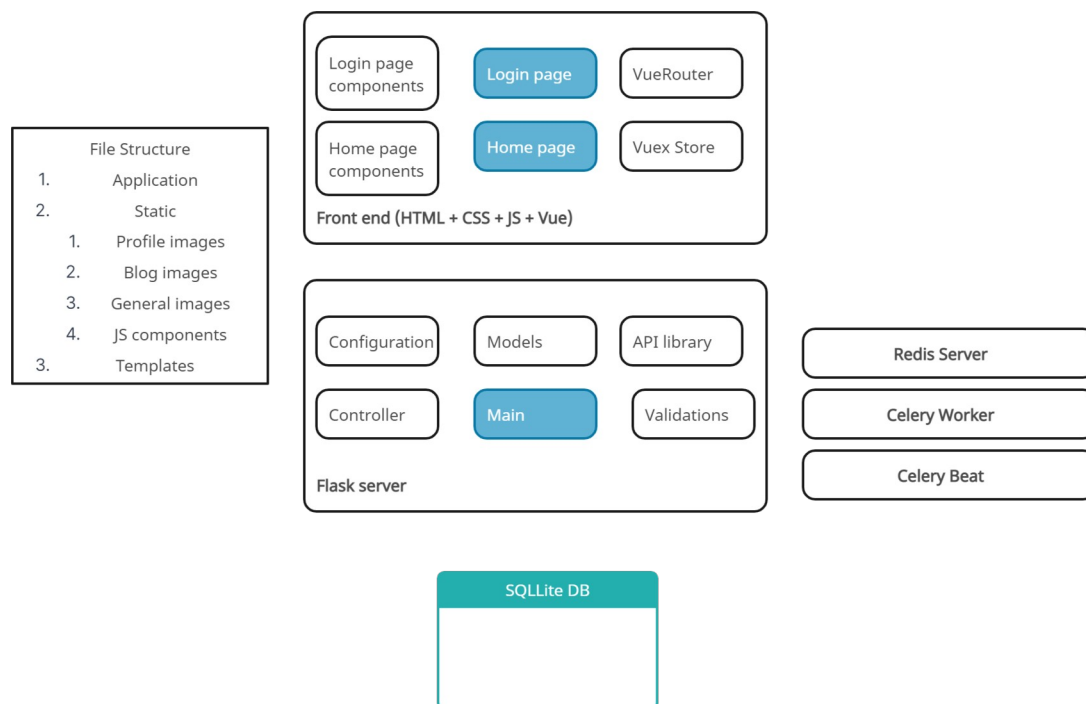

1. A user can post none, one or more blogs.
2. A user can follow none, one or more other users
3. Each blog post can have none, one or more comments by followers (user)
4. Each blog post can have none, one or more likes by followers (user)
5. Each blog comment can have none, one or more likes by followers (user)
6. ~~Each blog comment can have none, one or more comments by followers (user)~~ (Not Implemented)

API Design

APIs have been created and used for the following

1. User management -
 - a. Add a user, Edit a user, Change password, Forgot password
 - b. Login and Logout
 - c. Follow a user, Unfollow a user
2. Blog Management
 - a. Add a post, Edit a post
 - b. Add comments to a post
 - c. Like / Unlike a post or Like / Unlike a comment to a post
 - d. View a post given a blog id or all posts permitted for a user
 - e. Export a post
 - f. Reminders on inactivity
 - g. Monthly activity report

Architecture and Features

The key features around User management including creating accounts, editing their details, managing passwords have been implemented. The users can also create and manage their blog posts. They can also view blogs of people they are following and react to those posts either by liking the posts or commenting on them. They can also react to comments on posts by other users too. The application has been designed keeping in mind a seamless user experience that will enable actions that are context based. Appropriate validations are made to ensure data going in valid.
